                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note=Torgan: Anthracnose-infected leaves from
two-week-old sorghum plants 48 hr after inoculation;
Vector: pBluescript II from Lambda Zap II; Site_1: XhoI;
Site_2: EcoRI; Two-week-old sorghum plants (BTX 623)
cultivar) were infected with pathogen (isolate FRM42I of
Collectorrichum graminicola, which is a sorghum isolate).
RNA was prepared from infected leaves harvested from 45
seedlings 48 hours after inoculation. Note: young
seedlings (2 weeks old) exhibit juvenile resistant
reaction, which is an incompatible interaction. As they
grow older (4 weeks or older), plants resume susceptibility
to anthracnose disease. The library was made from poly-A
RNA in the cloning vector lambda ZAP II. Clones to be

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The specification describes polypeptides encoded by the Rht gene (and Cits homologues) that, when expressed in Triticum Aestivum, inhibit growth of the plant. This growth inhibition is antagonised by growth of the plant. This growth inhibition is antagonised by growth of the plant. This growth inhibition is antagonised by glaberellin. The products can be used to provide Rht expression in plants, conferring a dwarf phenotype on a plant which is correctable by treatment with gibberellin. In addition, the products can be used to produce Rht mutant plants which are dwarfed compared with wild-type, the dwarfing being gibberellin insensitive. Taller plants may be made by knocking out Rht or the relevant homologous gene in the plant of interest. Plants may be made which are resistant to compounds which inhibit gibberellin biosynthesis, such as paclobutrazol, e.g. to allow use of a gibberellin biosynthesis inhibitor to keep weeds charf but let crop plants grow tall. The present sequence is encoded by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                            The present invention relates to a method for identifying a modulator of gamma aminobutyric acid_B (GABA_B) receptor-mediated activity, by monitoring the interaction between a CREB/AFF transcription factor capable of binding to GABA_B receptor. The present sequence is the leucine zipper domain of human AFFx (see AAB80892), which was used in the method of the present invention. AFFx is a member of the CREB/AFF family of transcription factors. AFFx contains a bZIP domain, by which it interacts with the coiled coil domain of GABA_B receptor activity are useful for treating central nervous system or peripheral nervous system disorders.
                                                                                                                                                                                                                                                                                                                                                                                   Identifying modulators of gamma aminobutyric acid(GABA)-B receptor mediated activity by monitoring the interaction between GABAB receptor and the CREB/ATF transcription factors in the presence of a test
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          White

                                                                                                                                                                                  gamma aminobutyric acid_B (GABA_B) receptor-mediated activity, by monitoring the interaction between a CREB/ATF transcription factor capable of binding to GABA_B receptor. The present sequence is human ATFx, which was used in the method of the present invention. ATFx is a member of the CREB/ATF family of transcription factors. ATFx contains a bZIP domain, by which it interacts with the coiled coil domain of GABA_B receptor. Modulators of GABA_B receptor activity are useful for treating

These protein sequences were identified using the fusion proteins given in AAW21731-32. Compounds which interfere with the interaction of NuMA with a known NLP (NuMA interacting protein) are used to modulate cell division and/or proliferation. Ab, raised conventionally using NLP-1 or -2 as immunogen, are used to detect NLP (or their complexes) and to block their activity for diagnostic or therapeutic use, e.g. to detect defective NuMA or NLP which may be. markers for aberrant (including malignant) cell growth (which can also be detected by nucleic acid sequencing). Also where malignancy is related to defects in NuMA or NLP, it can be treated by administration of the appropriate functional protein. This protein is rich in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      McPherson

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers sets can be used in antisense therapy and in gene therapy. The primers are slow useful for the particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAB9593 represent human amino acid sequences; and AAH13629 to AAH13632 represent coligonucleotides, all of which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             02-MAY-2000;

                                                                                                                                  The present invention relates to a method for identifying a modulator of gamma aminobutyric acid_B (GABA_B) receptor-mediated activity, by monitoring the interaction between a CREB/ATF transcription factor capable of binding to GABA_B receptor. The present sequence is human ATFx, which was used in the method of the present invention. ATFx is a member of the CREB/ATF framily of transcription factors. ATFx contains a bZIP domain, by which it interacts with the coiled coil domain of GABA_B receptor. Modulators of GABA_B receptor activity are useful for treating central nervous system or peripheral nervous system disorders. The present sequence has an N-terminal extension compared to AAB80892.
                                                                                                                                                                                                                                                                                                                                            Identifying modulators of gamma aminobutyric acid(GABA)-B receptor mediated activity by monitoring the interaction between GABAB receptor and the CREB/ATF transcription factors in the presence of a test
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         31-AUG-2000; 2000WO-GB03361

The transcription factor may be used to produce a plant having modified gene expression such as a woody plant e.g. a eucalyptus, pine, acacia, poplar, sweetgum, teak, or mahogany species or to modify the activity of a polypeptide in a plant. The transcription factors of the present invention are members from the following families of regulatory proteins: bZIP family of G-box binding factors, basic helix-loop-helix zipper, homeotic/homeodomain/homeobox/MADS, homeodomain zipper, LIM domain, AP2 and EREBS, zinc finger domains of type 2 Cys2His2, CCAAT box elements and MYB.

                                                                                 AAF71138 to AAF71357 encode the Corynebacterium glutamicum homeostasis and adaptation (HA) proteins given in AAF7923 to AAF79242. The C. glutamicum HA genes (I) can be used in vectors for expression in host cells and production of fine chemicals, such as, an organic acid, proteinogenic or nonproteinogenic amino acid (preferred), purine or pyrimidine base, nucleoside, nucleotide, lipid, saturated or unsaturated fatty acid, diol, carbohydrate, aromatic compound, vitamin, cofactor, polyketide or enzyme. The amino acids produced can be lysine, glutamine, glutamate, alanine, aspartate, glycine, serine, threonine, methionine, cysteine, valine, leucine, isoleucine, arginine, prodine, histidine, tyrosine, phenylalanine, or tryptophan. The fine chemical production can be modulated. The presence of (I) or HA proteins encoded by then are used for diagnosing the presence or activity of Corynebacterium alphtheriae. (I) can be used to map the C. glutamicum genome or can be
                                                                                                                                                                                                                                                                                                                                                         New isolated Corynebacterium glutamicum nucleic acid for production modulation of production of fine chemicals such as amino acids, nucleosides, nucleotides, lipids, fatty acids, carbohydrates, vitami
Sequence
                                       used as markers for genetically engineered Corynebacterium or Brevibacterium. The HA proteins encoded by the (I) are used to maintain homeostasis in C. glutamicum or help the microorganism to adapt to

                                                                                                                                                                                                                                                                                                                             analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides a number of nucleotide and procesus sequences from the Coryneform bacterium Corynebacterium glutamicum. These sequences from the Coryneform bacterium, or a gene derived from a mutant of coryneform bacterium, measuring expression amount and mutant of coryneform bacterium, measuring expression amount and gene derived

                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-off primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5' end
                                                                                                                                                                                          the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primers sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 represent human amino acid sequences; AAB92446 to AAH3633 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                          sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at least 15 nucleotides and the combination of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI;
                                                                                                                                                                             of the present invention.

Title: US-09-485-529-103
Perfect score: 13
Sequence: 1 LNAPPPPLPPAPQ 13

Scoring table: OLIGO
Gapop 60.0 , Gapext 60.0

Searched: 219241 seqs, 76174552 residues

Word size : 0

Total number of hits satisfying chosen parameters: 219241

Minimum DB seq length: 0
Maximum DB seq length: 2000000000

Post-processing: Listing first 45 summaries

Database :

PIR\_68:\*

1: pir1:\*
2: pir2:\*
3: pir3:\*
4: pir4:\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
